## Absolute Maxima and Absolute Minima of a function

Let  $y = f(x)$  be a function defined on  $[a, b]$ . By local maximum (or local minimum) value of the function at a point  $c \in [a, b]$  we mean the greatest or least value in the immediate neighborhood of  $x = c$ . It does not mean greatest or maximum (or the least or the minimum) of  $f(x)$  in the interval  $[a, b]$ . A function may have a number of local maximum or local minimum in a given interval even a local minimum may be greater than a local maximum.

Thus, a local maximum value may not be the greatest (the maximum) value and a local minimum value may not be the least (the minimum) value of the function in any given interval as shown in the figure.

## Working rules to find out Absolute Maxima and Absolute Minima.

We may use the following working rules for finding out the maximum (absolute maximum) and the minimum (absolute minimum) of a function  $f$  defined on closed interval  $[a, b]$ .

### STEP-1

Find  $f'(x) = \frac{dy}{dx}$

### STEP-2

Take  $f'(x)$  and find all values of  $x$ , let  $c_1, c_2, c_3, \dots, c_n$  be the values of  $x$ .

### STEP-3

Take the maximum and minimum values out of the values  $f(a), f(c_1), f(c_2), \dots, f(c_n), f(b)$ ,

The maximum and minimum values obtained is the absolute maximum or largest value and absolute minimum or smallest value of the function.

.

## Problem-1

Find the absolute maximum and minimum values of a function  $f$  given by  $f(x) = 2x^3 - 15x^2 + 36x + 1$  on the interval  $[1,5]$

## Problem-2

Find the absolute maximum and minimum values of a function  $f$  given by  $f(x) = 12x^{\frac{4}{3}} - 6x^{\frac{1}{3}}$ ,  $x \in [-1, 1]$

### Problem-3

Find the absolute maximum and minimum values of a function  $f$  given by  $f(x) = \sin x + \cos x$  in  $[0, \pi]$

## HOME ASSIGNMENT

Q1. Find the maximum value and minimum value of  $f(x) = x + \sin 2x$  in the interval  $[x, 2\pi]$

Q2. Find the absolute maximum and minimum values of a function  $f$  given by

$$f(x) = 3x^4 - 8x^3 + 12x^2 - 48x + 1 \quad \text{on the interval } [1,4]$$

Q3. Find the absolute maximum and minimum values of a function  $f$  given by

$$f(x) = (x - 2)\sqrt{x - 1} \quad \text{on the interval } [1,9]$$
