Chapter- 3 Matrices

Concept, notation, order, equality, types of matrices

A matrix is a rectangular arrangement of numbers or functions arranged into a fixed number of rows and columns. The element of a matrix is always enclosed in the bracket [] or (). Matrices are represented by capital letters like A, B, C, etc.

A matrix having m rows and n columns is called a matrix order m x n (read as m by n matrix). In general, a matrix of order m x n is written as.

a ₁₁	a ₁₂	a ₁₃	 a _{1n}
a ₂₁	a ₂₂	a ₂₃	 a _{2n}
	•••••		
	•••••		
a _{m1}	a _{m2}	a _{m3}	 a _{mn}] _{m×n}

It can also be written in compact form as A⁻¹ a_{ij} represent an element of ith row and jth column. **Question – 1**Changing your Tomorrow

Write all possible order of matrices having 24 elements

Solution: $1 \times 2, 2 \times 12, 3 \times 8, 4 \times 6, 6 \times 4, 8 \times 3, 12 \times 2, 24 \times 1$

Question – 2

Write a matrix of order 2×3 where aij = 2i - j

Solution:- A =
$$\begin{bmatrix} 1 & 0 & -1 \\ 3 & 2 & 1 \end{bmatrix}$$

Types of Matrices:-

Row Matrix:- A matrix is said to be a row matrix if it has only one row.

Example: $A = \begin{bmatrix} 2 & 3 & 5 & 7 \end{bmatrix}_{1 \times 4}$

Column Matrix:- a matrix having any number of rows but only one column is called a column matrix.

Example:- $A = \begin{bmatrix} 2 \\ 3 \\ 4 \\ 5 \\ 6 \end{bmatrix}_{5\times 1}$ Rectangular Matrix:-A matrix having m rows and n columns where $m \neq n$ is called a rectangular matrix. $A = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 7 & 6 \end{bmatrix}_{2\times 3}$ Square matrix:-It a matrix in which number of rows = number of columns $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}_{3\times 3}$

Diagonal Elements:-

The diagonal elements of a square matrix are the elements for which i = j. i.e the elements $a_{11}, a_{22}, a_{33}, \dots$. The line along which the diagonal elements lie is called the leading diagonal or principal diagonal.

Diagonal Matrix:-

It is a square matrix where diagonal elements are non-zero but the other elements are zero.

| MATHEMATICS | STUDY NOTES [MATRICES]

 $2 \ 0 \ 0$ Example:- 0 2 0 0 0 2

Scalar matrix:- It is a diagonal matrix where all the diagonal elements are equal

 $\begin{bmatrix} 2 & 0 & 0 \end{bmatrix}$ Example:- A = $\begin{bmatrix} 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix}$

Equality of Matrices

Two matrices are said to be equal if their order is the same and their corresponding elements are equal.

If
$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 2 & 3 \\ 4 & 5 \end{bmatrix}$$
 then $a = 2, b = 3, c = 4, d = 5$

Question:

If
$$\begin{bmatrix} x-y & 2x+z \\ 2x-y & 3z+w \end{bmatrix} = \begin{bmatrix} -1 & 5 \\ 0 & 13 \end{bmatrix}$$
 then find x, y, z and w

Solution:-

x - y = -12x + z = 5 $2\mathbf{x} - \mathbf{y} = \mathbf{0}$ 3z + w = 13

Solving x = 1, y = 2, z = 3, w = 4

Addition, multiplication and scalar multiplication.

Addition of Matrices:-

Matrix addition is defined only when they are of the same order. The sum of matrices A and B is a matrix whose elements are obtained by adding the corresponding elements of A and B.

Example:-

Let
$$A = \begin{bmatrix} 2 & 3 \\ -4 & 5 \end{bmatrix}, B = \begin{bmatrix} 1 & -2 \\ 0 & 4 \end{bmatrix}$$

 $A + B = \begin{bmatrix} 3 & 1 \\ -4 & 9 \end{bmatrix}, A - B = \begin{bmatrix} 1 & 5 \\ -4 & 1 \end{bmatrix}$

Γ.

Multiplication of a matrix by a scalar:-

If a scalar K is multiplied by a matrix A then all elements of matrix A are multiplied by constant K.

Example:- DUCATIONAL GROUP
If
$$A = \begin{bmatrix} 3 & 4 \\ -5 & 1 \end{bmatrix}$$
 find 5A Changing your Tomorrow

Solution:-

$$5A = \begin{bmatrix} 15 & 20 \\ -25 & 5 \end{bmatrix}$$

Example:-

If
$$A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & -1 & 2 \\ 3 & 4 & 0 \end{bmatrix}$$
, $B = \begin{bmatrix} 2 & -1 & 0 \\ 3 & 0 & 1 \\ 0 & 0 & 4 \end{bmatrix}$ find $3A + 4B$

Solution:-

$$3A + 4B = \begin{bmatrix} 3 & 6 & 9 \\ 0 & -3 & 6 \\ 9 & 12 & 0 \end{bmatrix} + \begin{bmatrix} 8 & -4 & 0 \\ 2 & 0 & 4 \\ 0 & 0 & 16 \end{bmatrix} = \begin{bmatrix} 11 & 2 & 9 \\ 12 & -3 & 10 \\ 9 & 12 & 16 \end{bmatrix}$$

Simple properties of addition, multiplication, and scalar multiplication

Properties:-

Closure Law:- A matrix added with a matrix always gives a matrix. So Closure Law satisfies.

Commutative Law: A + B = B + A

Associative Law: A + (B + C) = (A + B) + C

Existence of Additive Identity:-

A null matrix of the same order with the given matrix is the additive identity of the matrix.

$$\mathbf{A} + \mathbf{O} = \mathbf{O} + \mathbf{A} = \mathbf{A}$$

Example:-

The additive identity of A =
$$\begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \end{bmatrix}$$
 is $O_{2\times 3} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$ GROUP

Existence of additive inverse:-

A is the additive inverse of A

Question – 1

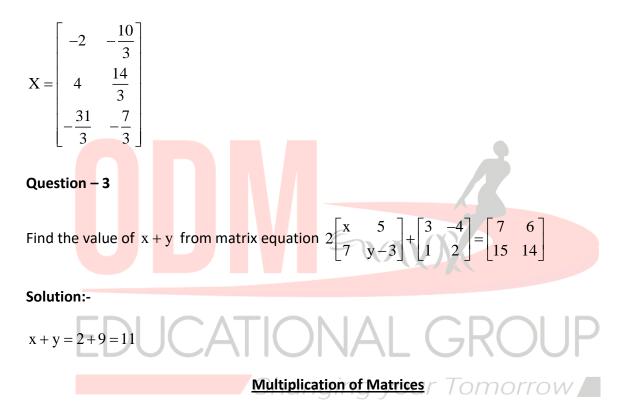

Find x and y if
$$2\begin{bmatrix} 1 & 3\\ 0 & x \end{bmatrix} + \begin{bmatrix} y & 0\\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 5 & 6\\ 1 & 8 \end{bmatrix}$$

Solution: x = y = 3

Question – 2

If
$$A = \begin{bmatrix} 8 & 0 \\ 4 & -2 \\ 3 & 6 \end{bmatrix}$$
, $B = \begin{bmatrix} 2 & -2 \\ 4 & 2 \\ -5 & 1 \end{bmatrix}$ then find the matrix X, such that $2A + 3X = 5B$

Solution:-

If A and B be any two matrices, then their product AB will be defined only when the number of columns is A is equal to the number of rows in B. if $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{n \times p}$ then their product $AB = C = [c_{ij}]$, will be a matrix of order $m \times x$, where, $(AB)_{ij} = c_{ij} = \sum_{r=1}^{n} a_{ir}b_{rj}$

Example:-

If
$$A = \begin{bmatrix} 1 & 4 & 2 \\ 2 & 3 & 1 \end{bmatrix}$$
 and $B = \begin{bmatrix} 1 & 2 \\ 2 & 2 \\ 1 & 3 \end{bmatrix}$

Then AB = $\begin{bmatrix} 1.1 + 4.2 + 2.1 & 1.2 + 4.2 + 2.3 \\ 2.1 + 3.2 + 1.1 & 2.2 + 3.2 + 1.3 \end{bmatrix}$

$$AB = \begin{bmatrix} 11 & 16 \\ 9 & 13 \end{bmatrix}$$

Properties of Matrix Multiplication:-

If A, B, and C are three matrices such that their product is defined, then

- > $AB \neq BA$ (Generally not commutative)
- \rightarrow (AB)C = A(BC) (Associative Law)
- > IA = A = AI (I is identity matrix for matrix multiplication)
- \rightarrow A(B+C) = AB + AC (Distributive Law)
- > If AB = AC this not implies that B = C (Cancellation Law is not applicable)
- If AB = 0 It does not mean that A = 0 or B = 0 again product of two non-zero matrices may be zero matrix.

Note:-

- > The multiplication of two diagonal matrices is again a diagonal matrix.
- > The multiplication of two triangular matrices is again a triangular matrix
- The multiplication of two scalar matrices is also a scalar matrix.
- If A and B are two matrices of the same order, then
 - $(A+B)^2 = A^2 + B^2 + AB + BA$
 - $(A-B)^2 = A^2 + B^2 AB BA$
 - $(A-B)(A+B) = A^2 B^2 + AB BA$
 - $(A+B)(A-B) = A^2 B^2 AB + BA$
 - A(-B) = (-A)B = -(AB)

Positive Integral Powers of the matrix:-

The positive integral powers of matrix A are defined only when A is a square matrix. Also then

A² = A.A A³ = A.A.A = A²A

Also for any positive integers m, n

(a)
$$A^{m}A^{n} = A^{m+n}$$
 (b) $(A^{m})^{n} = A^{mn} = (An)^{m}$ (c) $I^{n} = I, I^{m} = I$

(d) $A^{o} = I_{n}$ where A is a square matrix of order n.

Example – 1

If
$$A = \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$$
 and $A^2 - 4A - nI = 0$, then find the value of $A^2 - 4A - nI = 0$.

Solution:-

$$A^{2} = \begin{bmatrix} 5 & -4 \\ -4 & 5 \end{bmatrix}, 4A = \begin{bmatrix} 8 & -4 \\ -4 & 8 \end{bmatrix}, nI = \begin{bmatrix} n & 0 \\ 0 & n \end{bmatrix}$$

Changing your Tomorrow 📕

 $\Rightarrow A^2 - 4A - nI$

$$= \begin{bmatrix} 5-8-n & -4+4-0 \\ -4+4-0 & 5-8-n \end{bmatrix} = \begin{bmatrix} -3-n & 0 \\ 0 & -3-n \end{bmatrix}$$
$$\therefore A^2 - 4A - nI = 0$$
$$\Rightarrow \begin{bmatrix} -3-n & 0 \\ 0 & -3-n \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

 $\Rightarrow -3 - n = 0 \Rightarrow n = -3$

Example – 2

If
$$A = \begin{bmatrix} -1 & 2 \\ 3 & -4 \end{bmatrix}$$
 then find the element a_{21} of A^2

Solution:-

The element a_{21} is the product of the second row of A to the first column of A

$$\therefore a_{21} = \begin{bmatrix} 3 & -4 \end{bmatrix} \begin{bmatrix} -1 \\ 3 \end{bmatrix} = -3 - 12 = -15$$

Transpose of a Matrix:-

The matrix obtained from a given matrix A by changing its rows into columns or columns into rows is called transpose of matrix A and is dented by A^{T} or A'. From the definition, it is obvious that if the order of A is $m \times n$.

Example:- Transpose of Matrix
$$\begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{bmatrix}_{2\times 3} \begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \\ a_3 & b_3 \end{bmatrix}_{3\times 2}$$

Properties of Transpose:-
(a)
$$(A^{T})^{T} = A$$
 (b) $(A \pm B)^{T} = A^{T} \pm B^{T}$ (c) $(AB)^{T} = B^{T}A^{T}$

Non-commutative of multiplication of matrices and existence of non-zero matrices whose product is the zero matrix

Non-Commutative of multiplication of matrices:-

Example: If
$$A = \begin{bmatrix} 1 & -2 & 3 \\ -4 & 2 & 5 \end{bmatrix}$$
 and $B = \begin{bmatrix} 2 & 3 \\ 4 & 5 \\ 2 & 1 \end{bmatrix}$ find AB, BA, show that $AB \neq BA$

Solution:- AB =
$$\begin{bmatrix} 1 & -2 & 3 \\ -4 & 2 & 5 \end{bmatrix} \begin{bmatrix} 2 & 3 \\ 4 & 5 \\ 2 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -4 \\ 10 & 3 \end{bmatrix}_{2 \times 3}$$
, BA = $\begin{bmatrix} -10 & 2 & 21 \\ -16 & 2 & 37 \\ -2 & -2 & 11 \end{bmatrix}_{3 \times 3}$

Clearly $AB \neq BA$. So it is not commutative.

Zero Matrix as a product of two non zero matrices.

Example: $A = \begin{bmatrix} 0 & -1 \\ 0 & 2 \end{bmatrix}, B = \begin{bmatrix} 3 & 5 \\ 0 & 0 \end{bmatrix} AB = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$

If the product of two matrices is a zero matrix, one of the matrices doesn't need to be a zero matrix.

Application of Matrices:-

Example – 1

Use matrix multiplication to divide Rs. 30, 000 in two parts such that the total annual interest at 9% on the 1st part and 11% on the second part amount Rs. 3060/-

Solution:- A =
$$\begin{bmatrix} x & 3000 - x \end{bmatrix}$$

$$R = \begin{bmatrix} 0.09 \\ 0.11 \end{bmatrix} AR = 3060$$

$$\Rightarrow \begin{bmatrix} x & 30000 - x \end{bmatrix} \begin{bmatrix} 0.09 \\ 0.11 \end{bmatrix} = 3060$$
Changing your Tomorow

 $\Rightarrow x = 1200$

Two parts are 1200, 1800

Example – 2 Let
$$A = \begin{bmatrix} 0 & -\tan\frac{\alpha}{2} \\ \tan\frac{\alpha}{2} & 0 \end{bmatrix}$$
 and I be the identity matrix of order 2.Show that I + A

$$= (I - A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$$

Solution:-

We have,

$$I + A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & -\tan\frac{\alpha}{2} \\ \tan\frac{\alpha}{2} & 0 \end{bmatrix} = \begin{bmatrix} 1 & -\tan\frac{\alpha}{2} \\ \tan\frac{\alpha}{2} & 1 \end{bmatrix}$$

$$And I - A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & \tan\frac{\alpha}{2} \\ -\tan\frac{\alpha}{2} & 0 \end{bmatrix} = \begin{bmatrix} 1 & \tan\frac{\alpha}{2} \\ -\tan\frac{\alpha}{2} & 1 \end{bmatrix}$$

$$\therefore (I - A) = \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix} + \begin{bmatrix} 1 & \tan\frac{\alpha}{2} \\ -\tan\frac{\alpha}{2} & 1 \end{bmatrix} = \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix}$$

$$= \begin{bmatrix} 1 & \tan\frac{\alpha}{2} \\ -\tan\frac{\alpha}{2} & 1 \end{bmatrix} = \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix}$$

$$= \begin{bmatrix} 1 & \tan\frac{\alpha}{2} \\ -\tan\frac{\alpha}{2} & 1 \end{bmatrix} = \begin{bmatrix} 2\tan\frac{\alpha}{2} \\ 1 + \tan^{2}\frac{\alpha}{2} \\ 1 + \tan^{2}\frac{\alpha}{2} \end{bmatrix}$$

$$2\tan\frac{\alpha}{2} \\ \frac{1 + \tan^{2}\frac{\alpha}{2}}{1 + \tan^{2}\frac{\alpha}{2}} \end{bmatrix}$$

$$\Rightarrow (I - A) = \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix} = \begin{bmatrix} 1 & t \\ -t & 1 \end{bmatrix} \begin{bmatrix} \frac{1 - t^{2}}{1 + t^{2}} & -\frac{2t}{1 + t} \\ \frac{2t}{1 + t^{2}} & \frac{1 - \tan^{2}\frac{\alpha}{2}}{1 + \tan^{2}\frac{\alpha}{2}} \end{bmatrix}$$

$$DDD$$

$$\Rightarrow (I - A) = \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix} = \begin{bmatrix} 1 & t \\ -t & 1 \end{bmatrix} \begin{bmatrix} \frac{1 - t^{2}}{1 + t^{2}} & -\frac{2t}{1 + t^{2}} \\ \frac{2t - 1 - t^{2}}{1 + t^{2}} \end{bmatrix}$$
where $t = \tan\frac{\alpha}{2}$

$$\Rightarrow (I - A) \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix} = \begin{bmatrix} \frac{1 - t^{2} + 2t^{2}}{1 + t^{2}} & -\frac{2t + t - t^{2}}{1 + t^{2}} \\ \frac{-t + t^{3} + 2t}{1 + t^{2}} & \frac{2t^{2} + 1 - t^{2}}{1 + t^{2}} \end{bmatrix}$$

$$\Rightarrow (\mathbf{I} - \mathbf{A}) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} = \begin{bmatrix} \frac{1 + t^2}{1 + t^2} & \frac{-t(1 + t^3)}{1 + t^2} \\ \frac{t(1 + t^2)}{1 + t^2} & \frac{1 + t^2}{1 + t^2} \end{bmatrix} = \begin{bmatrix} 1 & -t \\ t & 1 \end{bmatrix}$$

$$\Rightarrow (I-A) \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix} = \begin{bmatrix} 1 & -\tan \frac{\alpha}{2} \\ \tan \frac{\alpha}{2} & 1 \end{bmatrix} = I + A$$

Example – 3

If
$$A = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$$
, prove that $(aI + bA)^n = a^nI + na^{n-1}bA$

Where I is a unit matrix of order 2 and n is a positive integer.

Solution:-

We shall prove the result by mathematical induction on n.

Step – 1, When n = 1, by the definition of integral powers of a matrix, we have

$$(aI+bA)^{1} = aI+bA = a^{1}I+1a^{0}bA = a^{1}I+1a^{1-1}bA$$

So, the result is true for n = 1

Step – 2, Let the result be true for n = m. Then

 $\left(aI+bA
ight)^m=a^mI+ma^{m-1}bA$. Now we shall show that the result is true for $\ n=m+1$

i.e
$$(aI+bA)^{m+1} = a^{m+1}I + (m+1)a^mbA$$

By the definition of integral powers of a matrix, we have

$$(aI+bA)^{m+1} = (aI+bA)^m (aI+bA)$$

$$\Rightarrow (aI + bA)^{m+1} = (a^{m}I + ma^{m-1}bA)(aI + bA)$$

$$\Rightarrow (aI + bA)^{m+1} = (a^{m}I)(aI) + (a^{m}I)(bA) + (ma^{m-1}bA)(aI) + (ma^{m-1}bA)(bA)$$

$$\Rightarrow (aI + bA)^{m+1} = (a^{m}a)(II) + a^{m}b(IA) + ma^{m}b(AI) + ma^{m-1}b^{2}(AA)$$

$$\Rightarrow (aI + bA)^{m+1} = a^{m+1}I + a^{m}bA + ma^{m}bA + ma^{m-1}b^{2}A^{2}$$

$$\Rightarrow (aI + bA)^{m+1} = a^{m+1}I + (ma^{m}b + a^{m}b)A + ma^{m-1}b^{2}A^{2}$$

$$\Rightarrow (aI + bA)^{m+1} = a^{m+1}I + (m+1)a^{m}bA + ma^{m-1}b^{2}O$$

$$\begin{bmatrix} \because A = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \Rightarrow A^{2} = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \end{bmatrix}$$

$$\Rightarrow (aI + bA)^{m+1} = a^{m+1}I + (m+1)a^{m}bA$$

This shows that the result is true for n = m + 1, whenever it is true for n = m. Hence, by the principle of mathematical induction, the result is valid for any positive integer n.

Example – 4 If A is a square matrix such that $A^2 = A$ show that $(I + A)^3 = 7A + I$

Solution:- Using matrix multiplication, we obtain 9 your Tomorrow

$$(\mathbf{I}+\mathbf{A})^2 = (\mathbf{I}+\mathbf{A})(\mathbf{I}+\mathbf{A})$$

= I(I+A) + A(I+A)

 $= I^2 + IA + AI + A^2$

 $= I + A + A + A^2$

 $=I+2A+A^{2}$

$$=I+2A+A$$

=I+3A $\therefore (\mathbf{I} + \mathbf{A})^3 = (\mathbf{I} + \mathbf{A})^2 (\mathbf{I} + \mathbf{A})$ $\Rightarrow (I+A)^3 = (I+3A)(I+A)$ = I(I+A) + 3A(I+A) $= I^{2} + IA + 3(AI) + 3(AA)$ $= I + A + 3A + 3A^{2}$ = I + A + 3A + 3A .=I+7ASymmetric and Skew symmetric matrices. **Symmetric Matrix:** A square matrix $A = \begin{bmatrix} a_{ij} \end{bmatrix}$ is called symmetric matrix if $a_{ij} = a_{ji}$ for all I, j, or $\mathbf{A}^{\mathrm{T}} = \mathbf{A} \ .$ h g Example:- h b f Changing your Tomorrow g f c

Note:-

Every unit matrix and square zero matrix are symmetric matrices.

> Maximum number of different elements in a symmetric matrix is $\frac{n(n+1)}{2}$

Skew-Symmetric Matrix:- A square matrix $A = [a_{ij}]$ is called the skew-symmetric matrix. If $a_{ij} = -a_{ji}$ for all, I, j or $A^T = -A$

Example:- $\begin{bmatrix} 0 & h & g \\ -h & 0 & f \\ -g & -f & 0 \end{bmatrix}$

Note:-

- > All principal diagonal elements of the skew-symmetric matrix are always zero because for any diagonal element $a_{ii} = -a_{ii} \Rightarrow a_{ii} = 0$
- The diagonal elements of a skew-symmetric matrix are always 0.
 Proof:

Let $A = [a_{ij}]$ be a skew-symmetric matrix. Then, $a_{ij} = -a_{ji}$ for all i, j $\Rightarrow \quad a_{ii} = -a_{ii}$ for all values of i $\Rightarrow \quad 2 a_{ii} = 0$ $\Rightarrow \quad a_{ii} = 0$ for all values of i

$$\Rightarrow a_{11} = a_{22} = a_{33} = \dots = a_{nn} = 0.$$

Example:- DUCATIONAL GROUP
1. If the matrix
$$A = \begin{bmatrix} 0 & a & 5 \\ 3 & b & -1 \\ c & 1 & 0 \end{bmatrix}$$
 is skew-symmetric. Find the value of a, b, c

Answer:

For a skew-symmetric $A = [a_{ij}]$, we have $a_{ij} = -a_{ji}$ for all $i \neq j$ and $a_{ii} = 0$ for all iThus, if $A = \begin{bmatrix} 0 & a & 3 \\ 2 & b & -1 \\ c & 1 & 0 \end{bmatrix}$ is skew-symmetric, then $A_{22} = 0$, $A_{12} = -A_{21}$ and $A_{31} = -A_{13}$. $\Rightarrow \qquad b = 0, \ a = -2$ and c = -3

2. Let A be a square matrix then prove that \rightarrow A+A' is a symmetric matrix Prove: Let $P = A + A^T$. Then, $[:: (A+B)^T = A^T + B^T]$ $P^{T} = (A + A^{T})^{T} = A^{T} + (A^{T})^{T}$ $[\because (A^T)^T = A]$ $\Rightarrow P^T = A^T + A$ $\Rightarrow P^T = A + A^T = P$ [By commutativity of matrix addition] *P* is a symmetric matrix. \rightarrow A – A' is a skew-symmetric matrix Prove: Let $Q = A - A^T$. Then, $Q^T = (A - A^T)^T = A^T - (A^T)^T$ $[:: (A+B)^T = A^T + B^T]$ $\Rightarrow Q^T = A^T - A$ $[:: (A^T)^T = A]$ $\Rightarrow Q^T = -(A - A^T) = -Q$ \Rightarrow *Q* is skew-symmetric \succ AA^T and A^TA are symmetric matrices Prove: $(AA^T)^T = (A^T)^T A^T$ [By reversal law] $[:: (A^T)^T = A]$ $(AA^T)^T = AA^T$ ⇒ AA^T is symmetric ⇒ Similarly, it can be proved that $A^T A$ is symmetric. 2. If A and B are symmetric matrices then show that AB is symmetric iff AB = BA Prove: AB is symmetric \Leftrightarrow $(AB)^T = AB$ $[:: (AB)^T = B^T A^T]$ $\Leftrightarrow B^T A^T = AB$ [: A and B are symmetric matrices : $A^T = A, B^T = B$] $\Leftrightarrow BA = AB$

4. Let A and B are symmetric matrices of same order then show that

 \blacktriangleright A + B is a symmetric matrices

Prove:

We have, $(A + B)^T = A^T + B^T = A + B$ A + B is symmetric

AB-BA is a skew-symmetric matrix Prove:

$$(AB - BA)^{T} = (AB)^{T} - (BA)^{T}$$
$$(AB - BA)^{T} = B^{T} A^{T} - A^{T} B^{T}$$
$$(AB - BA)^{T} = BA - AB$$
$$(AB - BA)^{T} = - (AB - BA)$$
$$AB - BA \text{ is skew-symmetric.}$$

AB+BA is a symmetric matrix Prove:

$$(AB + BA)^{T} = (AB)^{T} + (BA)^{T}$$
$$= B^{T}A^{T} + A^{T}B^{T}$$
$$= BA + AB$$
$$= AB + BA$$
AB + BA is symmetric matrix.

[By reversal law] [$\therefore B^T = B, A^T = A$]

 $[\because A^T = A, B^T = B]$

[By reversal law] [$:: A^T = A, B^T = B$]

Theorem – 1

Every square matrix can be uniquely expressed as the sum of a symmetric and skew-symmetric matrix.

Proof

Let A be a square matrix then
$$A = \frac{1}{2}(A + A') + \frac{1}{2}(A - A') = P + Q$$

Now
$$P^{T} = \frac{1}{2} (A + A^{T})^{T} = \frac{1}{2} (A^{T} + A) = P$$

$$\Rightarrow P^{T} = P, \text{ so T is a symmetric matrix.}$$

$$Q^{T} = \left(\frac{1}{2} (A - A^{T})\right)^{T} = \frac{1}{2} (A^{T} - (A^{T})^{T})$$

$$= \frac{1}{2} (A^{T} - A)$$

$$= -\frac{1}{2} (A - A^{T}) = -Q$$

$$\Rightarrow Q^{T} = -Q$$
So Q is a skew-symmetric matrix.
Question:
Question:
Express the matrix $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & -3 & -4 \\ 1 & -2 & -3 \end{bmatrix}$ as the sum of a symmetric and skew-symmetric matrix.
Here

$$B' = \begin{bmatrix} 2 & -1 & 1 \\ -2 & 3 & -2 \\ -4 & 4 & -3 \end{bmatrix}$$
Let

$$P = \frac{1}{2} (B + B') = \frac{1}{2} \begin{bmatrix} 4 & -3 & -3 \\ -3 & 6 & 2 \\ -3 & 2 & -6 \end{bmatrix} = \begin{bmatrix} 2 & \frac{-3}{2} & \frac{-3}{2} \\ -\frac{3}{2} & 3 & 1 \\ -\frac{3}{2} & 1 & -3 \end{bmatrix},$$
Now

$$P' = \begin{bmatrix} 2 & -\frac{3}{2} & -\frac{3}{2} \\ -\frac{3}{2} & 3 & 1 \\ -\frac{3}{2} & 1 & -3 \end{bmatrix} = P$$

Thus $P = \frac{1}{2}(B + B')$ is a symmetric matrix. Also, let $Q = \frac{1}{2}(B - B') = \frac{1}{2}\begin{bmatrix} 0 & -1 & -5 \\ 1 & 0 & 6 \\ 5 & -6 & 0 \end{bmatrix} = \begin{bmatrix} 0 & \frac{-1}{2} & \frac{-5}{2} \\ \frac{1}{2} & 0 & 3 \\ \frac{5}{2} & -3 & 0 \end{bmatrix}$ Then $Q' = \begin{bmatrix} 0 & \frac{1}{2} & \frac{5}{3} \\ \frac{-1}{2} & 0 & -3 \\ \frac{-5}{2} & 3 & 0 \end{bmatrix} = -Q$

Thus
$$Q = \frac{1}{2}(B-B')$$
 is a skew symmetric matrix.
Now $P+Q = \begin{bmatrix} 2 & \frac{-3}{2} & \frac{-3}{2} \\ \frac{-3}{2} & 3 & 1 \\ \frac{-3}{2} & 1 & -3 \end{bmatrix} + \begin{bmatrix} 0 & \frac{-1}{2} & \frac{-5}{2} \\ \frac{1}{2} & 0 & 3 \\ \frac{5}{2} & -3 & 0 \end{bmatrix} = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} = B$

Thus, B is represented as the sum of a symmetric and a skew symmetric matrix.

Concept of elementary row and column operations.

Elementary Transformations or elementary operations of a matrix:-

The following three operations applied on the rows (columns) of a matrix are called elementary row (column) transformation.

Changing your Tomorrow

- \blacktriangleright Interchange of any two rows (columns) denoted by $R_i \Leftrightarrow R_i$ or $C_i \Leftrightarrow C_i$
- > Multiplying all elements of a row (column) of a matrix by a non-zero scalar denoted by $R_i \rightarrow kR_i$ or $C_i = kC_i$
- Adding to the elements of a row (column), the corresponding elements of any other row (column) multiplied by any scalar K, dented by $R_i \rightarrow R_i + kR_i \text{ or } C_i \rightarrow C_i + kC_i$

Method of finding the inverse of a matrix by Elementary transformation:-

Let A be a non-singular matrix of order n. Then A can be reduced to the identity matrix I_n by a finite sequence of elementary transformation only. As we have discussed every elementary row transformation of a matrix is equivalent to pre-multiplication by the corresponding elementary matrix. Therefore there exist elementary matrices E_1 , E_2 E_4 such that $(E_k E_{k-1}....E_2 E_1)A = I_n$

$$\Rightarrow (E_k E_{k-1} \dots E_2 E_1) A A^{-1} = I_n A^{-1} \text{ (post multiplying by } A^{-1} \text{)}$$

$$\Rightarrow (\mathbf{E}_{\mathbf{k}}\mathbf{E}_{\mathbf{k}-1}\dots\mathbf{E}_{2}\mathbf{E}_{1})\mathbf{I}_{\mathbf{n}} = \mathbf{A}^{-1} \quad (::\mathbf{I}_{\mathbf{n}}\mathbf{A}^{-1} = \mathbf{A}^{-1} \text{ and } \mathbf{A}\mathbf{A}^{-1} = \mathbf{I}_{\mathbf{n}})$$

$$\Rightarrow A^{-1} = (E_k E_{k-1} \dots E_2 E_1) I_n$$

Algorithm for finding the inverse of a non-singular matrix by elementary row transformations:-

Let A be a non-singular matrix of order n

Step – I:- Write
$$A = I_n A$$

Step – II:- Perform a sequence of elementary row operations successively on the LHS and the prefactor I_n on the RHS till we obtain the result $I_n = BA$

Step – III:- Write $A^{-1} = B$.

The following steps will be helpful to find the inverse of a square matrix of order 3 by using elementary row transformations.

Changing your Tomorrow

Step – I:- Introduce unity at the intersection of the first row and first column either by interchanging two rows or by adding a constant multiple of elements of some other row to the first row.

Step – II:- After introducing unity at (1, 1) place introduce zeros at all other places in the first column.

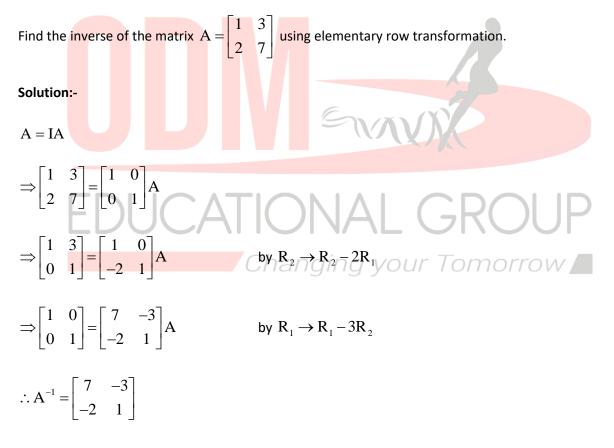

Step – III:- Introduce unity at the intersection 2^{nd} row and 2^{nd} column with the help of the 2^{nd} and 3^{rd} row.

Step – IV:- Introduce zeros at all other places in the second column except at the intersection of 2^{nd} and 2^{nd} column.

Step – V:- Introduce unity at the intersection of 3rd row and third column.

Step – VI:- Finally introduce zeros at all other places in the third column except at the intersection of the third row and third column.

Example:-1

Problem

Using elementary transformation find the inverse of following matrices.

 $\mathbf{A} = \begin{bmatrix} 1 & 2 \\ 2 & -1 \end{bmatrix}.$

Answer:

In order to use elementary row operations we may write A = IA.

or
$$\begin{bmatrix} 1 & 2 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} A, \text{ then } \begin{bmatrix} 1 & 2 \\ 0 & -5 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix} A \text{ (applying } \mathbb{R}_2 \to \mathbb{R}_2 - 2\mathbb{R}_1\text{)}$$
or
$$\begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ \frac{2}{5} & \frac{-1}{5} \end{bmatrix} A \text{ (applying } \mathbb{R}_2 \to -\frac{1}{5}\mathbb{R}_2\text{)}$$
or
$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{5} & \frac{2}{5} \\ \frac{2}{5} & \frac{-1}{5} \end{bmatrix} A \text{ (applying } \mathbb{R}_1 \to \mathbb{R}_1 - 2\mathbb{R}_2\text{)}$$
Thus
$$A^{-1} = \begin{bmatrix} \frac{1}{5} & \frac{2}{5} \\ \frac{2}{5} & \frac{-1}{5} \end{bmatrix}$$
Changing your Tomorrow

Homework:-

Using elementary transformation find the inverse of following matrices.

(a)
$$\begin{bmatrix} 3 & -1 \\ -4 & 2 \end{bmatrix}$$
 (b) $\begin{bmatrix} 2 & -6 \\ 1 & -2 \end{bmatrix}$ (c) $\begin{bmatrix} 6 & -3 \\ -2 & 1 \end{bmatrix}$

Invertible matrices and proof of the uniqueness of inverse if it exists

The uniqueness of Inverse:-

The inverse of a square matrix, if it exists, is unique

Let $A = \left(a_{ij}\right)_{\!\!\!\!n \times n}\,$ be any square matrix

If possible, A has two inverses B and C

 \Rightarrow AB = I = BA(1)

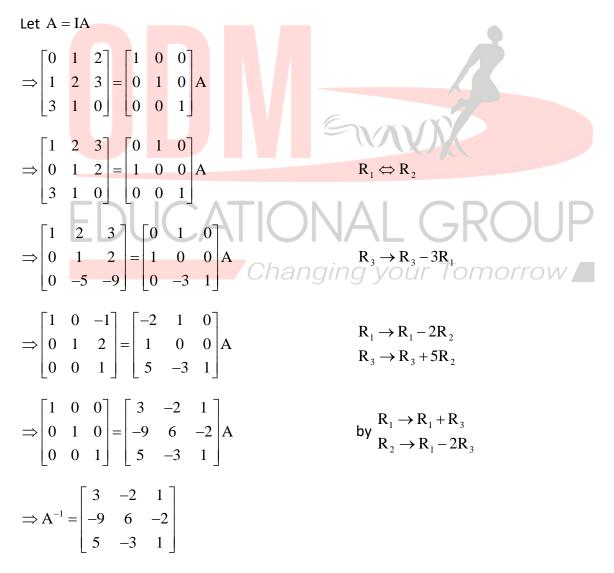

& AC = I = CA(2)

Now, B = BI = B(AC) = (BA)C = IC = C

Example – 1

 $\mathbf{A} = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & 1 & 0 \end{bmatrix}$

Solution:-

Problem – 1

Find the inverse of the matrix
$$A = \begin{bmatrix} 1 & 2 & -2 \\ -1 & 3 & 0 \\ 0 & -2 & 1 \end{bmatrix}$$
 by using elementary row transformation.

Answer:

$$A = IA$$

or,
$$\begin{bmatrix} 1 & 2 & -2 \\ -1 & 3 & 0 \\ 0 & -2 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 2 & -2 \\ 0 & 5 & -2 \\ 0 & -2 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 2 & -2 \\ 0 & 1 & 0 \\ 0 & -2 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 0 & -2 \\ 0 & 1 & 0 \\ 0 & -2 & 1 \end{bmatrix} = \begin{bmatrix} -1 & -2 & -4 \\ 1 & 1 & 2 \\ 2 & 2 & 5 \end{bmatrix} A$$

$$\Rightarrow \begin{bmatrix} 1 & 0 & -2 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -1 & -2 & -4 \\ 1 & 1 & 2 \\ 2 & 2 & 5 \end{bmatrix} A$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 2 & 6 \\ 1 & 1 & 2 \\ 2 & 2 & 5 \end{bmatrix} A$$

Hence,
$$A^{-1} = \begin{bmatrix} 3 & 2 & 6 \\ 1 & 1 & 2 \\ 2 & 2 & 5 \end{bmatrix}$$

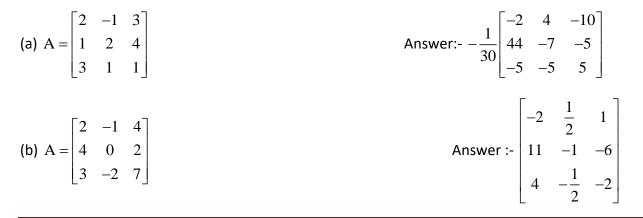

Problem – 2

$$A = \begin{bmatrix} 3 & -1 & -2 \\ 2 & 0 & -1 \\ 3 & -5 & 0 \end{bmatrix}$$
 find A^{-1} using elementary row transformation.

Answer:

Home Work:-

Find $\,A^{^{-1}}$, of the following matrices using elementary row transformation.

	3	0	-1]		3	-4	3]
(c) A =				Answer:-	-2	3	-2
	0	4	1		8	-12	9]

Word problems on matrices

EXAMPLE - 1

A factory produces three stickers P, Q and R printed with the messages 'SAVE TREES', 'SAVE ELECTRICITY' and 'SAVE FUEL' respectively. These stickers are sold in two markets, M_1 and M_2 . Annual sale (in units) is indicated below:

N THE STORE	Р	Q	R	
M_1	2000	4000	10000	
M ₂	5000	7000	3000	

Represent the above information in the form of a 2×3 matrix. What does the entry in the second row and first column represent?

Solution: We can represent the given information in the form of a 2×3 matrix given by

		P	Q	R	
	M_1	2000	4000	10000]
A =	M_2	5000	7000	3000]

Entry in second row and first column represents annual sale of sticker P in market M_2 .

Changing your Tomorrow 💻

EXAMPLE - 2

Two dealers P and Q sell three items, viz., notebooks, pencils and erasers. In the month of April, the dealer P sells 250 notebooks, 400 pencils and 300 erasers, whereas the dealer Q sells 350 notebooks, 500 pencils and 470 erasers. In the month of May, the dealer P sells 380 notebooks, 440 pencils and 360 erasers, whereas the dealer Q sells 450 notebooks, 520 pencils and 420 erasers. Using matrices, represent

- (i) the combined sale of two months for each dealer in each item?
- (ii) the change in sales from April to May for each dealer in each item?

Solution: We can represent the given sale information for the month of April as the following matrix:

		Notebook	Pencil	Eraser	
	P	250	400	300]
A =	Q	350	500	470	
	· L				

We can represent the given sale information for the month of May as the following matrix:

Notebook	Pencil	Eraser	
380	440	360	
450	520	420].
	380	380 440	380 440 360 100

(i) The matrix of combined sale of two months for each dealer in each item can be obtained by adding the two matrices, which is given by

$$A + B = \begin{bmatrix} 250 & 400 & 300 \\ 350 & 500 & 470 \end{bmatrix} + \begin{bmatrix} 380 & 440 & 360 \\ 450 & 520 & 420 \end{bmatrix}$$
$$= \begin{bmatrix} 250 + 380 & 400 + 440 & 300 + 360 \\ 350 + 450 & 500 + 520 & 470 + 420 \end{bmatrix} = \begin{bmatrix} 630 & 840 & 660 \\ 800 & 1020 & 890 \end{bmatrix}$$

Hence, the combined sale of two months for each dealer in each item has the following form:

	Notebook	Pencil	Eraser
P	630	840	660]
Q	800	1020	890]

(ii) The matrix of change in sales from April to May for each dealer in each item can be obtained by taking the difference the two matrices, which is given by

$$B - A = \begin{bmatrix} 380 & 440 & 360 \\ 450 & 520 & 420 \end{bmatrix} - \begin{bmatrix} 250 & 400 & 300 \\ 350 & 500 & 470 \end{bmatrix}$$
$$= \begin{bmatrix} 380 - 250 & 440 - 400 & 360 - 300 \\ 450 - 350 & 520 - 500 & 420 - 470 \end{bmatrix} = \begin{bmatrix} 130 & 40 & 60 \\ 100 & 20 & -50 \end{bmatrix}.$$

Hence, the change in sales from April to May for each dealer in each item has the following form:

NotebookPencilEraser
$$P$$
1304060 Q 10020-50

EXAMPLE - 3

A builder is constructing a three-storey building. Each storey is to be installed with 20 fans, 30 tube lights and 25 LED bulbs. Represent the above information as a column matrix. Using scalar multiplication, find the total number of electrical items of each type in the building.

Solution: We can represent the given information of electrical items as the following matrix:

	Fan	20	1
A =	Tube light	30	
	LED light	25	

The matrix of total electrical items of each type in the building can be obtained by multiplying the above matrix with the number of storeys, which is given by

$$3A = 3 \begin{bmatrix} 20\\ 30\\ 25 \end{bmatrix} = \begin{bmatrix} 60\\ 90\\ 75 \end{bmatrix}.$$

Hence, the total number of fans, tube lights and LED lights in the building are 60, 90 and 75 respectively.

EXAMPLE - 4

A book store has 20 mathematics books, 15 physics books and 12 chemistry books. Their selling prices are \gtrless 300, \gtrless 320 and \gtrless 340 each respectively. Find the total amount the store will receive from selling all the items.

D

Changing your Tomorrow 📕

Solution: We can represent the given price information as the following Price Matrix:

	Price		
Mathematics	300		
Physics	320		
Chemistry	340		

We can represent the given sale information as the following Sale Matrix:

	Mathematics	Physics	Chemistry
Book store	20	15	12 .

Then, the amount received by the book store from selling all the items can be obtained by multiplying the sale matrix and price matrix, which is given by

$$\begin{bmatrix} 20 & 15 & 12 \end{bmatrix} \begin{bmatrix} 300 \\ 320 \\ 340 \end{bmatrix} = 6000 + 4800 + 4080 = 14880$$

Hence, total amount is ₹ 14880.

EXAMPLE - 5

Three schools A, B and C organized a mela for collecting funds for helping the rehabilitation of flood victims. They sold hand-made fans, mats and plates from recycled material at a cost of \gtrless 25, \gtrless 100 and \gtrless 50 each. The number of articles sold are given below:

School	A	В	С	
Hand-fans	40	25	35	
Mats	50	40	50	
Plates	20	30	40	

Find the funds collected by each school separately by selling the above articles. Also find the total funds collected for the purpose.

Solution: We can represent the given price information as the following Price Matrix:

 $\begin{array}{c} \text{Price} \\ \text{Hand-fans} & \begin{bmatrix} 25 \\ 100 \\ 100 \\ 100 \\ 50 \\ \end{array} \right].$

We can represent the given sale information as the following Sale Matrix:

	Hand-fans	Mats	Plates
School A	40	50	20
School B	25	40	30
School C	35	50	40

Then, the matrix of funds collected by the schools can be obtained by multiplying the sale matrix and price matrix, which is given by

[40	50	20]	[25]		1000 + 5000 + 1000		7000	
25	40	30	100	=	625 + 4000 + 1500	=	6125	
			50		875 + 5000 + 2000		[7875]	

Hence, amounts raised by school A, school B and school C are \gtrless 7000, \gtrless 6125 and \gtrless 7875 respectively.

١X

Also, the total funds collected = \mathbf{E} (7000 + 6125 + 7875) = \mathbf{E} 21000.

Page 30
