

# WORK SHEET

## LESSON - Human nervous system

Date \_\_\_\_\_

Page \_\_\_\_\_

### HOMEWORK

1) Cranial nerves are attached to the brain and emerge from the skull.

2) Synapse

3) Myelina

4) The individual neurons make contact through contact through these process. The terminal branches of the axon of one neuron lie - very close to the dendrites of another neuron. This point of contact is called Synapse.

5) The brain, master organ of body is protected by the hard bony covering called as skull or cranium and also it has three thin membranes known as meninges.

of course, you remove your hand away from the source of pain, either the hot object or the pin. In situations like these your reactions are always immediate, involuntary and sudden. They happen without much of a thinking process.
