

11) i) Height above ground
ii) Mass of the body.

12) It can possess Potential Energy. When the ball is at a height it possesses potential energy.

13) Potential Energy → the water stored in dam.
Kinetic Energy → when the water falls on the turbine.
Electrical Energy → when the ^{water falling on} turbine changes to electricity.

14) When the spring unwinds, potential energy changes into kinetic energy to move the arms of the watch.
