

HW
7/18/21

Ex - II
6, 7, 8, 9, 10, 11

- c) Respiration and combustion are the processes which maintain the balance between oxygen and CO_2 in the air.
- Respiration: Respiration is a chemical process that takes place in all living beings. In this process, oxygen present in the inhaled air reacts with the digested food material in the body. This results in the release of energy, carbon dioxide and water.
- Combustion: Burning or combustion is a process in which a substance reacts chemically with oxygen and gets oxidised, with the release of energy in the form of heat and light. It's a fast process. During the process of burning, along with energy, carbon dioxide and water vapour are also produced.

d) Similarities

Burning

- Oxygen is needed to combine with carbon and hydrogen in compound.
- CO_2 and H_2O are formed with release of energy.

Respiration

- Oxygen is needed to combine with C and H_2 of food
- CO_2 and H_2O are formed with release of energy.

Differences:

Burning

- It occurs at higher temperature.
- It is a fast process.
- An ~~not~~ artificial & discount in nature process.

Respiration

- It occurs at body temperature.
- It is a slow process.
- A natural and continuous process.

3) Rusting: Slow of conversion of iron into its hydrated oxide in presence of moisture and oxygen is called rusting. Colour of rusted iron is reddish-brown

Conditions for rusting:

- Presence of moisture (water)
- Presence of oxygen (air)

Chemical name of rust is hydrated iron oxide.

- a) Air helps movement of water boats
- b) Air speeds up drying up of agricultural products like grains, pulses, fruits etc. Air helps in pollination of flowers and dispersal of seeds.
- c) Windmills work where there is sufficient movement of air.
- d) Air filled tyres of cars move smoothly on road as there is less friction.

Important Notes

1) LPG or (Liquified Petroleum Gas): It is obtained from crude petroleum oil. It mainly contains gaseous compounds known as isobutane and butane. Popularly it is known as cooking gas. It is also supplied through pipes in big cities.

CNG (Compressed Natural Gas): It is produced along with crude oil. It mainly contains methane gas. It has become a popular fuel for vehicles like three wheelers, scooters, cars and buses. It is a cheap fuel as well as pollution free. It is used as a substitute of petrol.

Difference in composition

LPG is obtained from crude petroleum oil. It mainly contains gaseous compounds known as isobutane and butane. While

CNG is produced along with crude oil. It mainly contains methane gas.

- 1) a) Nitrogen constitutes 78% of air by volume. It is of vital importance to the plants, animals and human beings as it is needed to prepare vital nutrient 'protein' to every living being which is necessary for their growth.
- b) Nitrogen cannot be absorbed directly by plants. It is first fixed up in the soil as nitrites and nitrates and then absorbed by the plants in soluble forms. This phenomenon is called nitrogen fixation.
