

(a)

(b)

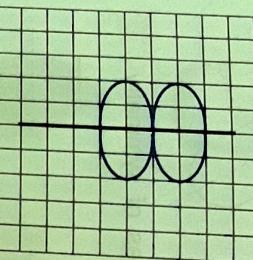

(c)

**Solution :**

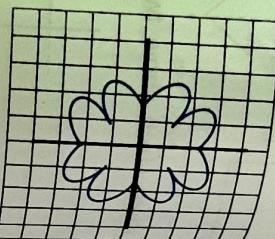

(a)

(b)

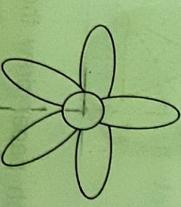

(c)

**EXERCISE 15(D)****1.** Draw all possible lines of symmetry in each of the following.

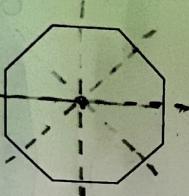

(a)

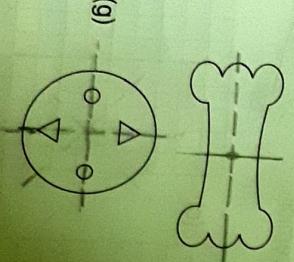

(b)

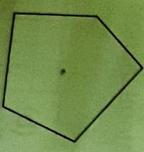

(c)

(d)

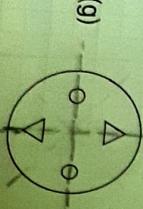

(e)

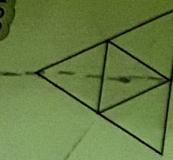

(f)

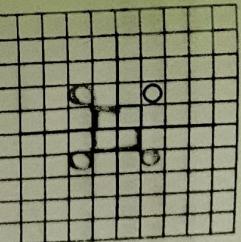

(g)

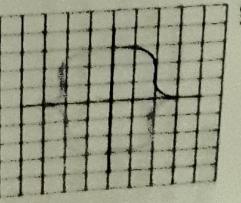

(h)

**3.** Complete the following figures using graph paper.

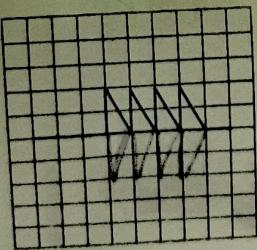

(a)

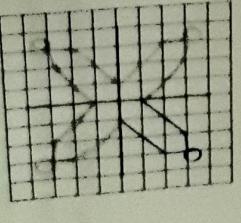

(b)

(c)

(d)

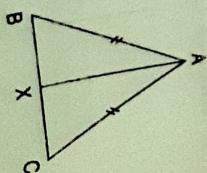

Let us now understand the symmetry of triangles.

The line of symmetry in a triangle is a line segment joining a vertex to the mid-point of the side opposite to that vertex. This line segment is called a **median** and it divides one side of the triangle in two equal parts. Let us consider the following triangle.

$\triangle ABC$ is an isosceles triangle.

$$AB = AC$$

AX is a line segment joining the vertex A to the mid-point of the side opposite to $\angle A$ i.e. BC . Since $BX = XC$, AX is the median of the triangle.

**2.** Draw the geometrical figure mentioned below and write the number of lines of symmetry possible for each.

- (a) Rectangle 2 lines
 (b) Equilateral triangle 3 lines
 (c) Scalene triangle 0 lines
 (d) Isosceles triangle 1 line
 (e) Trapezium 0 lines
 (f) Square 4 lines
 (g) Parallelogram 0 lines
 (h) Semicircle 1 line

- (a) 2 lines
 (b) 3 lines
 (c) 0 lines
 (d) 1 line
 (e) 0 lines
 (f) 4 lines
 (g) 0 lines
 (h) 1 line
