

Rainy Seasons.

The wet season (sometimes called the rainy season) is the time of year when most of a region's average annual rainfall occurs. Generally, the season lasts at least a month. It is generally caused due to changes in the flow of winds and other geological factors.

The rainy season brings much needed relief from the extreme heat of the preceding summer season, replenishing the rivers and lakes. This is the season where farmers look forward to, as rain becomes the saving grace for their crops. Floods, storms and other water related natural calamities usually occur during the rainy season.
