Tiger Chapter - 10Paragraph on Tiger

Tiger is a carnivorous animal known for its dark stripes on its orange brown fur, with a lighter underside. They weigh up to 300 kilograms. They are nocturnal animals and live between 20-25 years. Tigers are famous in India. Tigers are known as the largest among the cat family. According to world wildlife fund, the number of tigers has decreased by 95%. As the population of humans in the world continues to rise, the process of industrial development, urbanization, and agricultural growth remain to appear 'evil' as such steal and break into the wildlife of their natural habitat. Tigers play an important role in ecosystem. By preying on herbivores, tigers help to keep the balance between the prey animals and the forest vegetation which they feed upon. So we should protect tigers.
