

Q Early on winter morning we see drops of water on parked cars and plants. why?

Ans Dew drops are formed due to condensation of water vapours. The air around us contains water vapours which we call moisture or humidity. Hot air contains more moisture as compared to cold air. During the night when the ~~hot~~ hot air comes into contact with

Some cold surface, water vapour present in it condenses on the cold surface in the form of droplets. These tiny drops of water called dew drops.
