

Q Should we waste water?

Why or why not

Ans No we shouldn't waste water.

Water is a scarce and finite resource. →

71% of our Earth is covered in water, only 3% of it's fresh water out of the 3%, only 1% is available the remaining 2% being locked in glaciers.

and ice caps. This means that 1% alone must sustain an entire planet of inhabitants including humans, animals and plant life alike.

Fresh water is not a renewable resource. The more the population grows the less we will have, if we don't conserve it.
