

NERVOUS SYSTEM ODM CONNECT

Q1. Our nervous system helps us to detect and react to changes in the environment. Sense organs like the eyes, detect changes and our central nervous system coordinates a response.

Q2. REFLEX ACTION: is an involuntary and nearly spontaneous movement in response to our stimulus.

REFLEX ARC: The path taken by the nerve impulses in a reflex is called reflex arc. In higher animals, most sensory neurons do not pass directly into the brain synapse in the spinal cord.
