

4. How do animals like fish, elephant and leaf insect protect themselves?

Ans- Fishes, elephants and leaf insects protect themselves as

- Fishes can move fast enough to escape from their enemies.
- Elephants are too big to be eaten by other animals.

HW

23/9/21 Birds are winged creatures. An Ostrich cannot fly in spite of having wings. Why?

Ans- Ostrich cannot fly because they have very small wings and a heavy body. The small wings are not sufficient to lift the Ostrich's heavy body for a flight. The individual barbs are not inter-locked like a flying bird's feather. This means the feathers offer no wind resistance for them to get off the ground. Their flat breastbones lack the keel that anchors the strong pectoral muscles required for flight.
