

iii) Cardiac muscle

→ are also involuntary muscles ~~are also~~ but morphology of different kind. The cells are striated and compartmentally striated. Unlike the other cardiac are linked the reverse.

below:

Bones are under control of will of individual.

The muscles are in your command only when you want. For example, when you want.

ii) Unstriated Muscles

→ Unstriated Muscles are not under control of one's will. Movements like passage of food in the alimentary canal, for example, are caused by the contraction of the unstriated muscles. Unstriated muscles are composed of slender tapering cells. Muscles of the eye.

► Muscular tissue

→ Muscular tissues forms the muscles can contract and relax. Thus, they help the body in all its movement and in locomotion

Three distinct kinds of muscles are:

(i) Striated - (skeletal, striped or voluntary) muscles.

(ii) Unstriated (Smooth, unstriped or involuntary) muscles, etc.

(iii) Cardiac or heart muscles

→ Striated muscles

striated muscles found attached to
