

Why Icebergs are dangerous for ships?

More people live in the south of Greenland than in the north. Why

do you think this is so?

(i) Because icebergs are a very large piece of ice floating in the sea when an iceberg floats on water most of it remains under the water. They are very pointy and their sharp points can dig a hole in the ship and can damage the ship so icebergs are very dangerous for ships.

(ii) More people leave in the south of Greenland than in the north because south of Greenland is the warmer than the north.
