7/1/22

Q. Early on winter mornings we see drops of water on parked cars and plants. Why?

Ans:- Early on winter mornings we see drops of water on parked cars and plants, because of condensation.

Dew drops are formed due to condensation of water vapors which we call moisture or humidity. Hot air contains more moisture as compared to cold air.

During the night when surface, water vapor present in it condenses on the cold surface in the form of droplets. These tiny drops of water are called dew drops.
