Ch - 7

# Triangles

## Exercise - 7.1

ans,

Given,

AC and AD are equal and the line segment AB bisects  $\angle A$ .

Proof :- The two triangles ABC and ABD are similar i.e.  $\triangle ABC \cong \triangle ABD$

Proof :- In  $\triangle ABC$  and  $\triangle ABD$ ,

$$AC = AD \quad (\text{given})$$

$$AB = AB \quad (\text{common})$$

$$\angle CAB = \angle DAB \quad (\text{Since AB is the bisector of } \angle A)$$

$$\triangle ABC \cong \triangle ABD \quad (\text{SAS})$$

$$BC \text{ and } BD \text{ i.e. } BC = BD \quad (\text{C.P.C.T})$$

Ans

Given,

$$\triangle DAB = \triangle CBA$$

and  $AD = BC$

Prove:  $\rightarrow$  (i)  $\triangle ABD \cong \triangle BAC$

(ii)  $BD = AC$

(iii)  $\angle ABD = \angle BAC$

Proof: - (i) In  $\triangle ABD$  and  $\triangle BAC$

$$\begin{aligned} AB &= BA \quad (\text{common}) \\ \angle DAB &= \angle CBA \quad (\text{given}) \\ AD &= BC \end{aligned}$$

$$\triangle ABD \cong \triangle BAC \quad (\text{SAS})$$

(ii)  $\triangle ABD$  and  $\triangle BAC$

$$BD = AC \quad (\text{CPCT})$$

(iii) Since  $\triangle ABD$  and  $\triangle BAC$  so,

$$\angle ABD = \angle BAC \quad (\text{CPCT})$$

3ms

Given,

$AD = BC$  are two equal perpendiculars to  $AB$ .

Prove  $\Rightarrow$   $CD$  is the Bisector of  $AB$

Proof  $\Rightarrow$  In  $\triangle AOD$  and  $\triangle BOC$

$$\angle A = \angle B \quad (\text{perpendiculars})$$

$$AD = BC \quad (\text{given})$$

$$\angle AOD = \angle BOC \quad (\text{vert. opp. } \angle s)$$

$$\therefore \triangle AOD = \triangle BOC \quad (\text{AAS})$$

$$\text{So, } AO = OB \quad (\text{C.P.C.T})$$

Thus,

$CD$  bisects  $AB$

Given,  
that  $PQ$  and  $LM$

To prove:  $\triangle ABC \cong \triangle CDA$

Proof:- In  $\triangle ABC$  and  $\triangle CDA$ ,

$$\angle BCA = \angle DAC \text{ (alternate)}$$

$$\angle BAC = \angle DCA \text{ (int. } \angle\text{s)}$$

$$AC = CA \text{ (common)}$$

$$\triangle ABC \cong \triangle CDA \text{ (ASA)}$$

SAM

Given,

the line  $l$  is the bisector of  $\angle A$   
and line segments  $BP$  and  $BQ$  are  
perpendiculars drawn from  $B$

Prove:- (i)  $\triangle APB \cong \triangle AQB$

(ii)  $BP = BQ$  or  $B$  is equidistant from the arms of  $\angle A$

Proof:-

(i) In  $\triangle APB$  and  $\triangle AQB$

$\angle P$  and  $\angle Q$  (The two right angles)

$AB = AB$  (common)

$\angle BAP = \angle BAQ$  (As line  $l$  is the bisector of  $\angle A$ )

So,

$\triangle APB \cong \triangle AQB$  (AAS)

(ii)  $BP = BQ$  (C.P.T)

So,

It can be said, the point  $B$  is equidistant from the arms of  $\angle A$ .

Q. No. \_\_\_\_\_

Given,

$$\begin{aligned} AB &= AD \\ AC &= AE \\ \angle BAD &= \angle EAC \end{aligned}$$

To prove  $\rightarrow BC = DE$

Proof :-  $\angle BAD = \angle EAC$

Now by adding  $\angle DAC$  on both sides

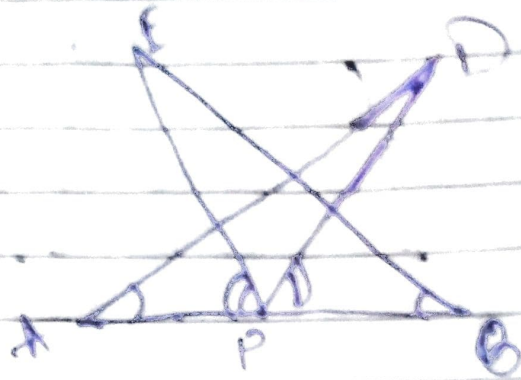

$$\begin{aligned} \angle BAD + \angle DAC &= \angle EAC + \angle DAC \\ \Rightarrow \angle BAC &= \angle EAD \end{aligned}$$

In  $\triangle ABC$  and  $\triangle ADE$

$$\begin{aligned} AC &= AE && \text{(given)} \\ \angle BAC &= \angle EAD && \text{(proved)} \\ AB &= AD && \text{(given)} \end{aligned}$$

So,  $\triangle ABC \cong \triangle ADE$  (SAS)

So,  
 $BC = DE$  (CPCT)

Given,

P is the mid-point of line-segment AB.

$$\angle BAD = \angle ABE$$

$$\angle EPA = \angle DPB$$

To prove  $\Rightarrow$  (i)  $\triangle ADP \cong \triangle BEP$

(ii)  $AD = BE$

Proof  $\rightarrow$  (i)  $\angle EPA = \angle DPB$

adding  $\angle DPE$  adding both sides

$$\angle EPA + \angle DPE = \angle DPB + \angle DPE$$

$$\therefore \angle DPA = \angle EPB \quad (\text{c'd})$$

P is the mid-point  $\therefore AP = BP$

In  $\triangle DAP$  and  $\triangle BEP$

$$\angle DPA = \angle EPB$$

$AP = BP$  (since P is the mid-point of line-seg AB)

$$\angle BAD = \angle ABE \quad (\text{given})$$

So,  $\triangle DAP \cong \triangle BEP$  (ASA)

(ii) So,  
 $AD = BE$  (CPCT)

SAS

Given,

M is the mid-point of line segment

AB,

$\angle C = 90^\circ$

$DM = CM$

Proof :- (i)  $\triangle AMC \cong \triangle BMD$

(ii)  $\angle DBC$  is a right angle.

(iii)  $\triangle DBC \cong \triangle ACB$

(iv)  $CM = \frac{1}{2} AB$

Proof :-  $\Rightarrow$  (i) In  $\triangle AMC \cong \triangle BMD$

$AM = BM$  (Since M is the mid-point)

$CM = DM$  (Given)

$\angle CMA = \angle DMB$  (Vert. Opp. Angle)

$\triangle AMC \cong \triangle BMD$  (SAS)

(ii)  $\angle ACM = \angle BDM$  (CPCT)

$AC = BD$  (CPCT)

②  $BD \parallel AC$  ( $\angle BDC = \angle ACD$  alternate  $\angle$ s)

$BD \parallel AC$  and  $BC$  transversal

$$\angle BDC + \angle ACB = 180^\circ$$

(co-int  $\angle$ s is supplementary)

$$\triangle BDC + 90^\circ = 180^\circ$$

$$\angle BDC = 180^\circ - 90^\circ = 90^\circ$$

③ In  $\triangle BDC$  and  $\triangle ACB$ ,

$$BC = CB \text{ (common)}$$

$$\angle BDC = \angle ACB \text{ (They are right angle)}$$

$$DB = AC \text{ (CPCT)}$$

So,

$$\triangle BDC \cong \triangle ACB \text{ (SAS)}$$

$$\textcircled{A} DC = AB \text{ (CPCT)}$$

$$\Rightarrow \frac{1}{2} DC = \frac{1}{2} AB$$

$$\textcircled{B} DM = \frac{1}{2} AB = CM$$

$$CM = \frac{1}{2} AB$$
