

Activity-1

- A farmer puts some seeds into a beaker full of water. He observes that most of the seeds sink and a few seeds float. It is believed that the seeds that remain afloat are bad ones and those which sink to the bottom are the good seeds. This method helps farmer to separate the good seeds from the bad ones. Such separation is possible only because of proper and careful observation.

Activity-2

- Take 3 glasses, A, B and C. Glass A contains hot water, glass B has lukewarm water and glass C contains cold water. Put one of your fingers in glass A and a finger of the other hand in glass C. Now put both fingers in glass B.
