

17/8/21

Floods are caused in water bodies and also on land. When there are heavy or continuing rains water bodies get more water than they can hold. The water level then rise in the water body, and overflow its banks. Such a flooding of water bodies also causes the flooding of water bodies and also causes the flooding of land beyond the water body.

Land may itself also get flooded if there is very heavy rainfall. Continuous rain on an otherwise dry land can

inundate the land. Floods also get changed  
caused in cities where the drainage  
system is poor when there are heavy  
rains such cities get flooded.
