

1 As we travel closer towards the center of the Earth the temperature increases.

2 The pressure increases as we travel down.

3 The three layers of the Earth's interior:-

* The crust

* The mantle

* The core

4 The upper crust is made up of silica and aluminium. The lower crust is made up of silica and magnesium.

5 True

6 * Upper crust are continental crust
* lower crust are oceanic crust

8 The upper mantle consists of minerals like silica, iron and magnesium. The lower mantle consists of minerals like iron, magnesium, aluminium and silicon.

9 The lithosphere consists of the crust and the outer part of the ~~or~~ upper mantle.

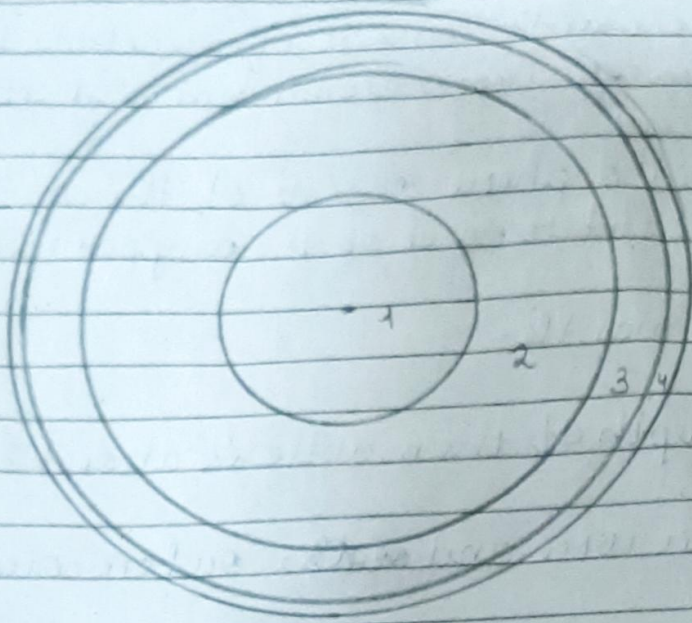

10 Upper mantle.

11 The depth of the mantle is about 2900 km.

12 Inner core and ~~outer~~ outer core.

13 NiFe (the layer is made up of nickel and ferrous iron also known as iron).

14)

- 1 Core
- 2 Mantle
- 3 Lithosphere
- 4 Crust

Key four layers

- * Lithosphere = The topmost layer of the earth.
- * Asthenosphere = The semi-liquid layer on which the lithosphere floats.
- * Mantle = The layer just below the crust.
- * Core = The innermost layer of Earth.
