Hw

A bat and a bird can fly, yet they are different from each other. How?

Ans A bat and a bird can fly, yet they are different from each other because they are different from each other. In the case of bird they can fly with their wing but in the case of bat they can fly with their additional 'fingers' that has a small layer of skin between the fingers. But the birds used arms with a single finger on the end. This allows a bat to have a better range of motion in its flying manner.
