1) How are roots useful to the plants? Give any two points.

Ans i) Roots absorb water, minerals and nutrients from soil.

ii) Roots hold the soil to keep the plant stand and strong.

2) What is vegetative reproduction?

Ans) New plants can be produced by certain parts of a plant such as the leaf, stem and root. These vegetative parts of a plant that are capable of giving rise to new plants are called propagules and the process is known as vegetative propagation.

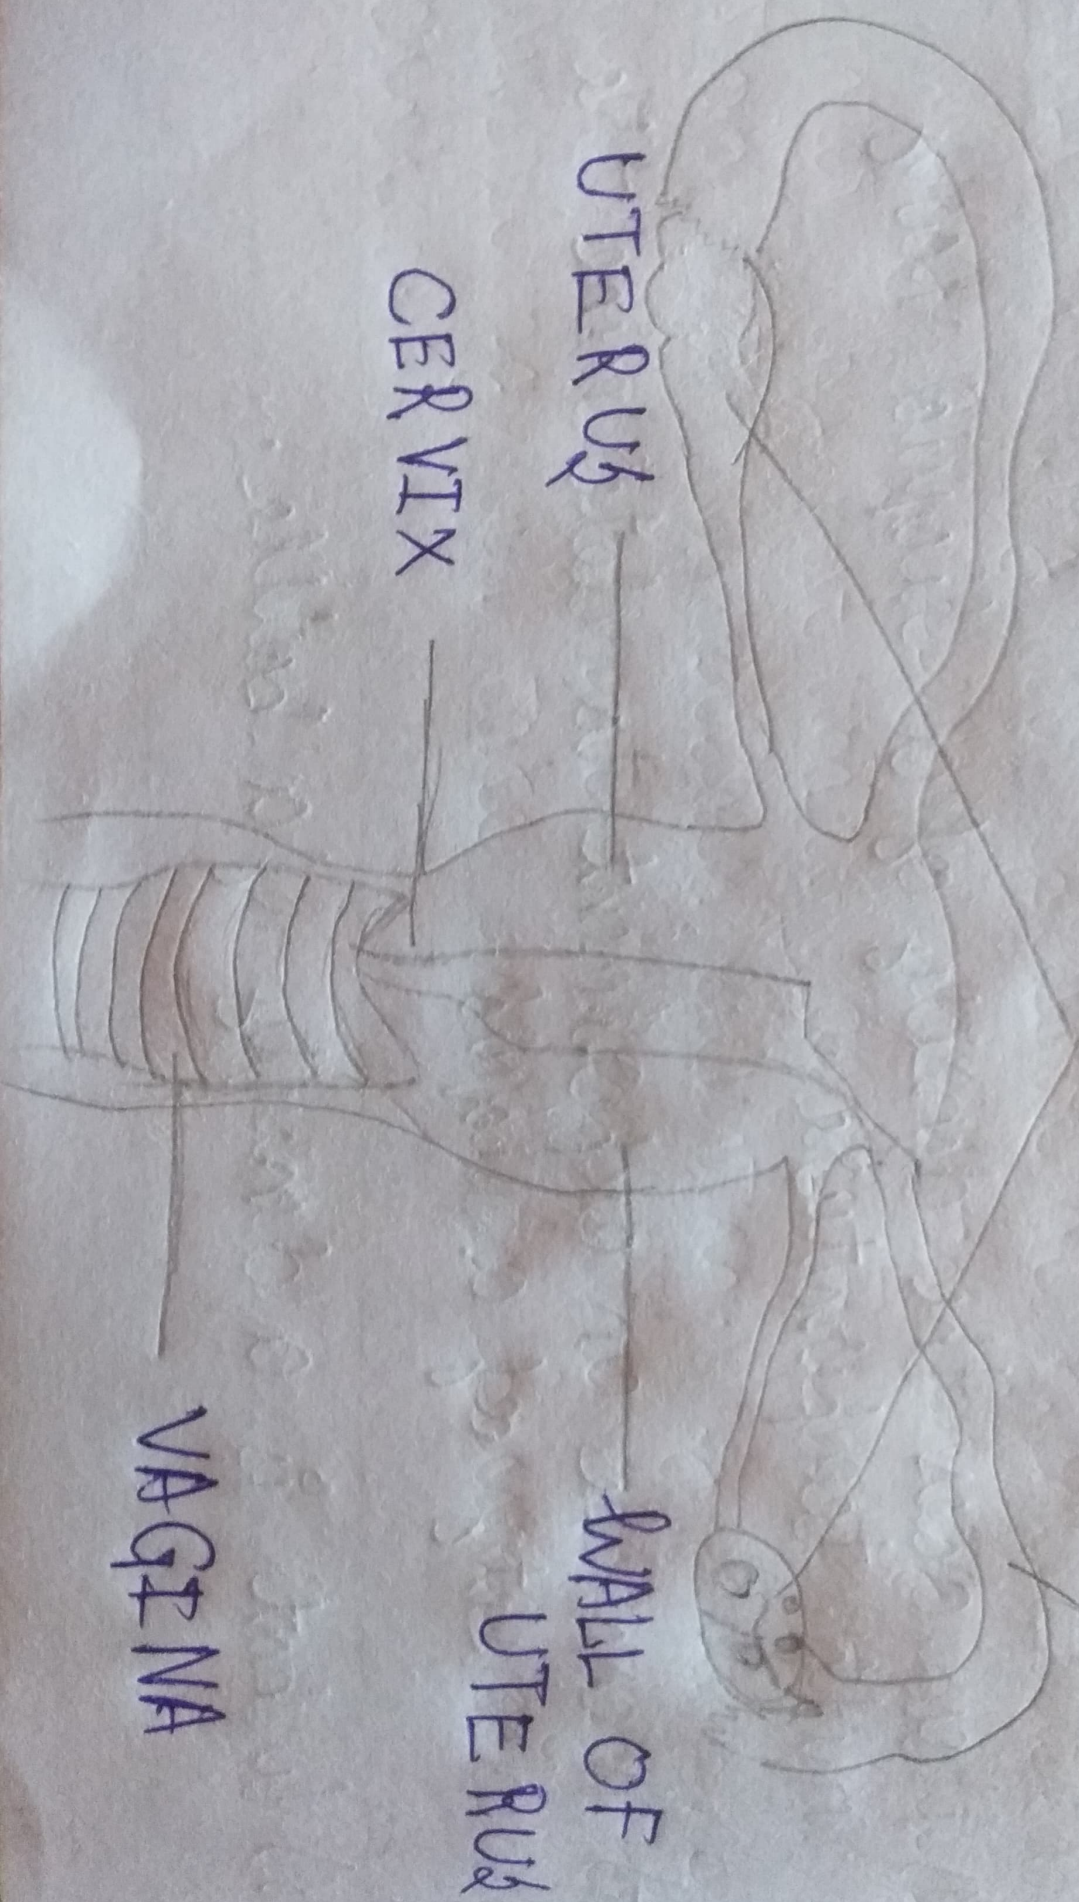

4) Define the terms flora and ~~flora~~ fauna?

Ans) Flora means the plants naturally occurring in a particular area and fauna means the animals naturally living in that area.

5) Why pituitary gland is called the master gland?

Ans) Pituitary gland secretes several hormones some of which regulate the activity of other endocrine glands. So, that it is called "master gland".

3) Draw and label different parts of female reproductive system.
