

# Reproduction In Plants

## Assignment-1

1) Name two characteristics of flowers in which pollination occurs by wind.

Ans) Two characteristics of flowers in which pollination occurs by winds are:-

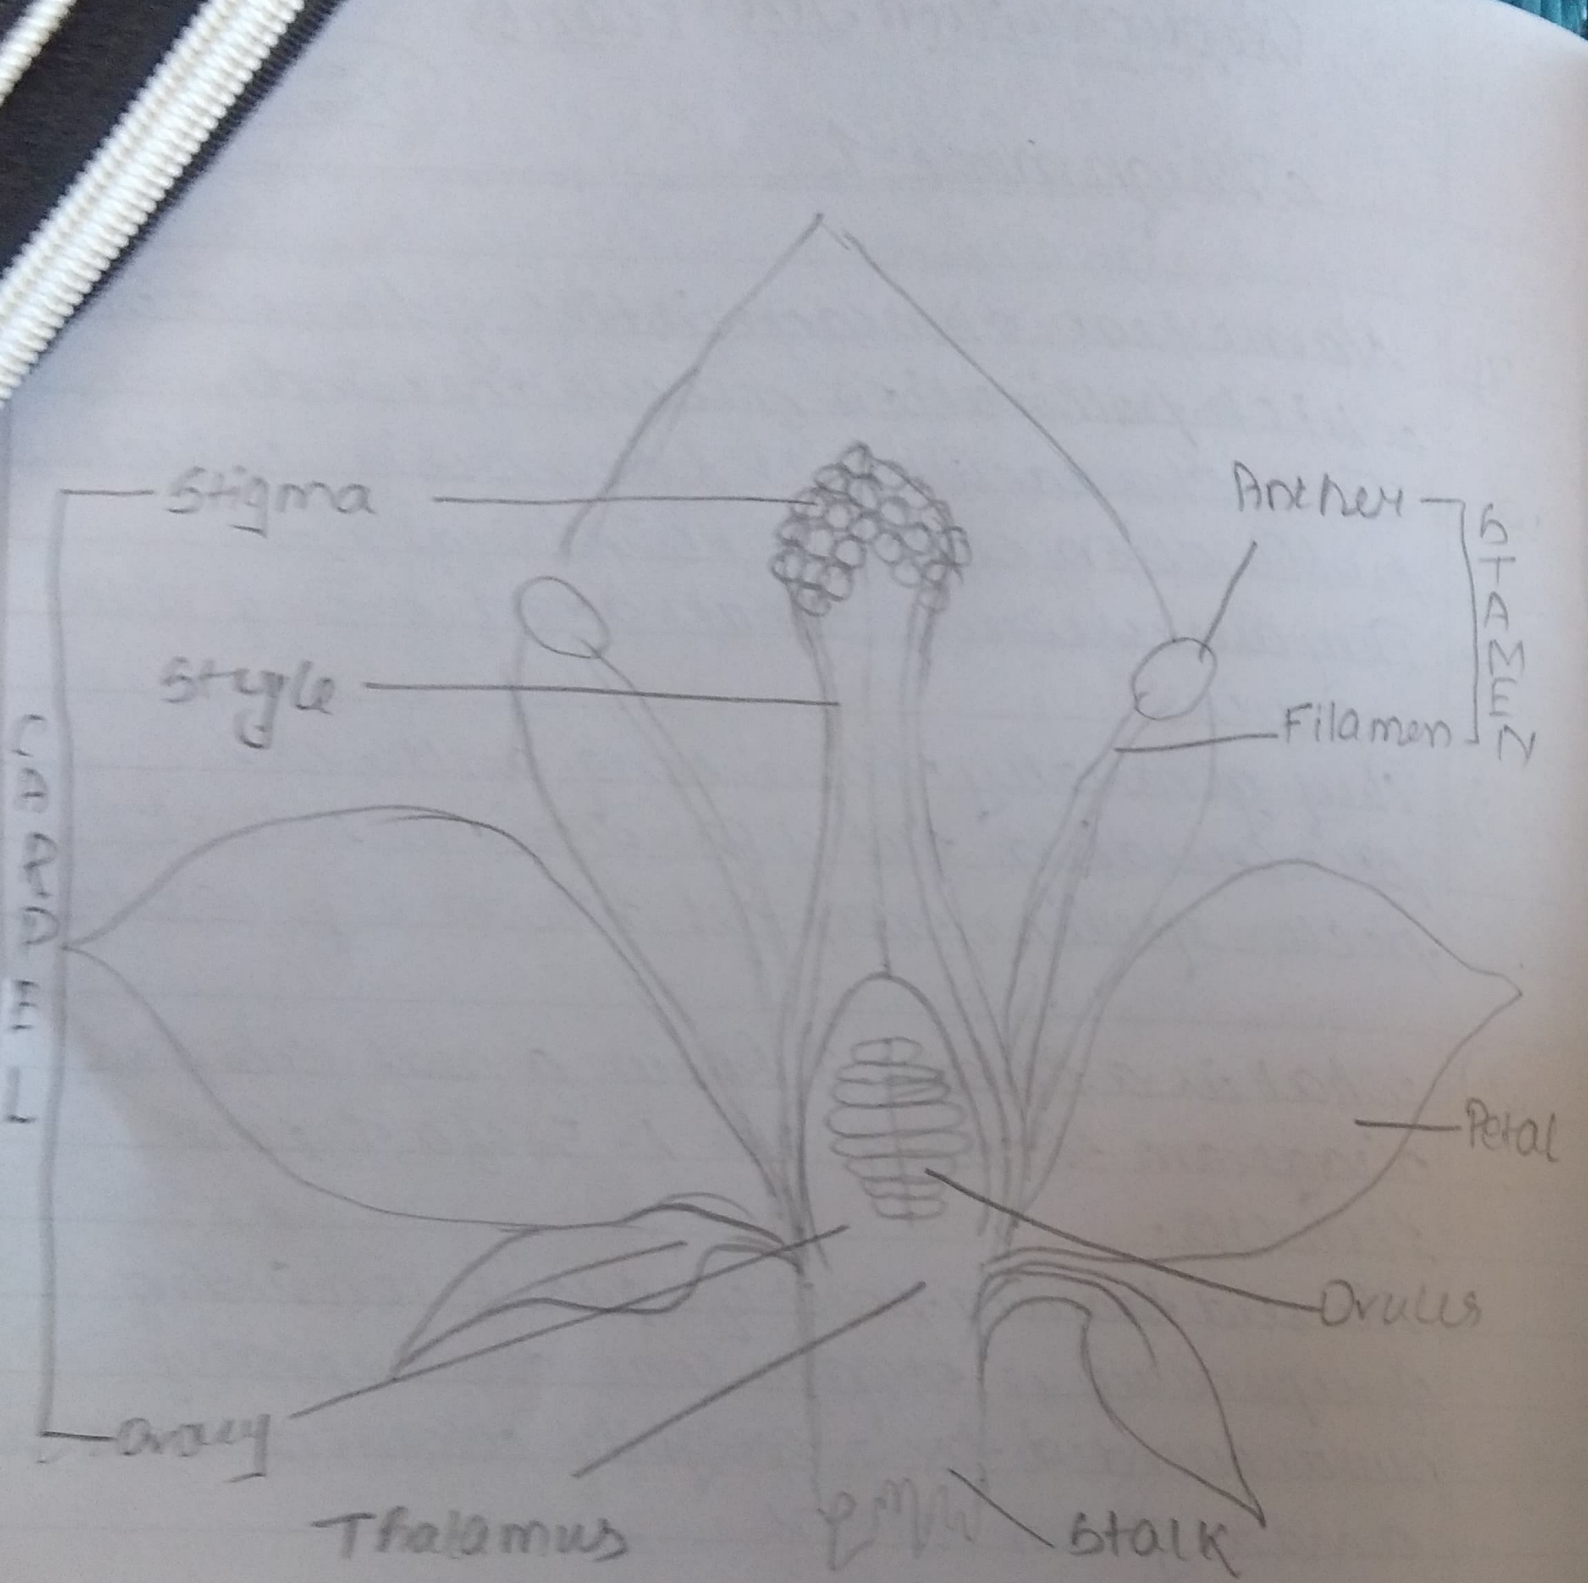

→ They are usually small and are of dull colours

→ They generally have long anthers protruding out of the flowers so that pollen grains may get blown off easily.

2) What is a flower? Draw a neat labelled diagram showing the L.S of a typical flower.

The seed bearing part of a plant consisting of reproductive organs that are typically surrounded by a brightly coloured corolla and a green calyx

A typical flower with its internal parts.
