

Write some of the adaptation of camel and polar bear

ans : CAMEL:

The camel has many adaptive traits for their life in desert. They have wide feet for walking in sand. They have long eyelashes and thin, slit nostrils that they can close to protect them from blowing sand. They are adapted to survive at a long time without water and food

POLAR BEAR:

A Polar Bear has a ~~thin~~ layer of fat under his skin which helps it to stay warm. The wide, large paws help him to walk on the snow. When a Polar bear swims underwater it closes his nostrils so no water can get in.
