

- 1) Why Epidermis is important for plants?
- 2) Cork cells are made impervious to water & gases by the presence of which substance?
- 3) Define Guttation.

### Answers

- 1) Epidermis is important for plants because it is the outermost layer of the plant which contains stomata. The stomata help in gaseous exchange & transpiration.
- 2) Cork cells are made impervious to water & gases by the presence of a chemical called Suberin.
- 3) The secretion of droplets of water from the pores of a plant is called Guttation.
