

HW

- 1) What do you mean by control and coordination ?
- 2) How nervous and endocrine system control and coordinates our body system?

Answer

1) Control is the power of restraining and regulation by which something can be started slowed down or stopped.

Co-ordination is the working together of various agents of the body of an organism in a proper manner to produce an appropriate reaction to a stimulus is called coordination.

2) Hypothalamus → This gland is located in your brain and controls your endocrine system. It uses information from your nervous system to determine when to tell other glands, including the pituitary gland to produce hormones.
