

Why is it important to save water?

ans. It is important to save water because:

(i) Water grows food ÷

Fruits and vegetables as well as other produce require water to grow.

(ii) It protects our ecosystem and wild life -

Humans are not the species on

Earth that requires water ~~for~~ for survival. without water, the aquatic life will stand no chance of survival.

(iii) Conserving water also saves energy - pumping water from the central facility requires high amount of energy. Saving

water will also lead to saving energy and reduce your carbon footprint.

(iv) Less water ~~using~~ usage means more saving-

By saving water, this ~~always~~ allows us to save more water especially on our water bill. water is a precious resource.
