Early on winter mornings we see drops of water on parked cars and plants. Why?

Ans - Dew drops are formed due to condensation of water vapours. The air around us contains water vapours which we call moisture or humidity. Hot air contains more moisture as compared to cold air. During the night when the hot air comes into contact with some cold surface, water vapour present in it condenses on the cold surface of the parked cars and plants. These tiny drops of water are called dew drops.
