

~~2.~~

## Revision.

1. Auto number datatype generates a sequential number whenever a record is added.
2. Insert datatype is used to embed an object created in another application.
3. We can add images by using OLE fields.
4. Calculated datatype is used when a user creates a table field that calculate values.
5. Access sets look up fields to the Lookup Wizard datatype.
6. The star topology handles large no of traffic.

7. In ring topology, all the nodes in the network are connected in a circular manner.

8. In star topology, the central server act as a hub.

9. In point to point topology, two nodes are directly connected.

10. Network architecture is divided into two types.

11. Wifi uses radio signals.

12. A network maintained without using wires is called wireless networking.

13. Wired and wireless are the different types of networking.

14. Network topology refers to the layout in which various components of the network are connected and communicate with each other.

15 Network security means protecting data and resources from any unauthorized access.

16 Wireless network is a device that connects wireless communication devices to form a wireless network.

17 Criteria property contains the condition in the basis of which records are filtered.

18 A form is a piece of paper in which a user fills the required information in specific fields.

19. A view is a database object that helps you to retrieve and view information from one or more database tables.

20 In a query the criteria property is used to set the condition on the basis of which the records are filtered.

21. You can set multiple criteria in a query using or property.

22. Sort property is used to filter the data either in an ascending or descending order.

23. Query allows you to add and update data in a table, one record at a time.

24. A report is an effective way to organise and summarize data in a printed form.

25. There are 5 types of operators in python.

26. The statements that govern the flow of a program are called control.

27. The datatype of a variable is an attribute that tells what kind of data can a variable have.

28 Concatenation is a string operation.

29 The Sequential construct executes the statements in a sequential manner.

30 Interactive mode of python gives the output instantly.
