

1) What is Reproduction? Why is it Important?

Sol. Reproduction is the biological Method of producing new offsprings of the same species. Reproduction is important for:

- Continuing the species / Keeping the species in Existence.
- Maintaining a balance in the Eco-system

2) List two differences between Asexual Reproduction and vegetative Propagation.

<u>Asexual Reproduction</u>	<u>Vegetative Propagation</u>
→ Its the process in which a single parent is involved in reproduction	Its the reproduction method in plants where new offsprings are produced from vegetative parts.
→ Its found in both Plants, Animals And Micro-organisms.	→ Its only found in Plants.
