

Homework

- ② AIDS is a preventable disease. Effective HIV prevention interventions have been proven to reduce HIV transmission. People who get tested for HIV & learn that they're infected can make significant behaviour changes to improve their health & reduce the risk of transmitting HIV to their drug-using partners.
- ② Skin, tears & mucus are part of the 1st line of defense in fighting infection. They help to protect us against invading pathogens. We have beneficial bacteria growing on our skin, in our bowel & other places in the body that stop other harmful bacteria from taking over.
- ③ Viruses are different to bacteria; they have a different structure & a different way of surviving. Viruses don't have cell walls that can be attacked by antibiotics, instead they're surrounded by a protective protein coat.
