

Homework

②

Antibiotics are the drugs that are used to cure diseases caused by bacteria. Antibiotic stops the production

of a compound needed for the growth of the cell wall of bacteria. This prevents the cell wall from expanding when the other parts of the cell are growing. Ex: Penicillin & Streptomycin.

② Hygienic conditions should be maintained in the surroundings we live in.

* There should be limited exposure to airborne microbes by providing not so crowded living conditions.

③ Public cleanliness is important for individual health. Public awareness of diseases, such as its mode of spread, causes & treatment can effectively stop the propagation of diseases. Cleanliness is paramount as diseases can easily spread if the environment is unclean.
