

1 More people live in the south of Greenland than in the north. Why do you think this is so? Why are ice-bergs dangerous for ships?

Ans → The Arctic circle passes through the southern part of Greenland. Most of Greenland therefore lies in the Northern Hemisphere, the region has a very cold climate. The south-western coast of Greenland is warmest part of the country. So most of the people live here. Icebergs being lighter than water float on water with a major part of their surfaces laying under the water surface and only a small part lies outside water. They it becomes difficult for the driver of the ship to estimate the size of iceberg.
