## Homework - ODM CONNECT

1)

Antibiotic is a chemical made from certain micro-organisms to kill other disease causing micro-organisms

Ex:- Penicillin, Streptomycin.

2) Two basic principles of preventing diseases are:-

- Ensure a clean environment, which helps in preventing vectors like mosquitoes from breeding
- To ensure proper nutrition to keep the immune system in a healthy state and also ensure consumption of healthy food and clean water

3) "Public cleanliness is important for individual health." Individuals generally suffers from various infectious diseases <sup>due</sup> to exposure to a unhygienic environment in our surrounding. So in order to protect ourselves from various communicable diseases, our environment should be clean and hygienic. This can be achieved by proper disposition and exemption of garbage, cover nose while sneezing and mouth while cough e.t.c and importantly by spreading awareness. Thus the statement is very true and practical.
