

1. How are lungs designed in human beings to maximise the area of exchange of gases ?.

ans. The pair of lungs are designed in humans in such a way that they are lined by a thin membrane where the smaller tubes called bronchioles a balloon like structure and the surface area for the exchange of gases have been increased by alveoli and blood capillaries.

(2) What is the function of lymph in our body ?

ans. Lymph carries the digested and absorbed fat the intestine and drain ~~off~~ excess fluid from extracellular space back into the blood.

→ Lymph maintain the tissue fluid and the volume of the blood .

(3) how is Haemoglobin associated with respiration.

ans. Haemoglobin, <sup>in blood</sup> take the oxygen and supply it to the organs or tissue which are deficient in oxygen. hence haemoglobin <sup>a.</sup> is also associated with respiration.
