C REACTIVE PROTEIN (CRP) quantitative

Test Description	Value(s)	Unit(s)	Reference Range
Sample Type	SERUM		
Result	2.9		
Titre	-	MG/L	-
Interpretation	UP TO 6 MG/L is Negative		
Method	Turbidimetry		

NOTE

- 1) C-reactive protein (CRP) is a protein found in the blood, the levels of which rise in response to inflammation (an acute-phase protein).
- 2) Its physiological role is to bind to phosphocholine expressed on the surface of dead or dying cells (and some types of bacteria) in order to activate the complement system via c1q. CRP is synthesized by the liver in response to factors released by fat cells (adipocytes).
- 2)It is a member of the pentraxin family of proteins. It is not related to C-peptide or protein C. CRP is used mainly as a marker of inflammation. Apart from liver failure, there are few known factors that interfere with CRP production.
- 3)Measuring and charting CRP values can prove useful in determining disease progress or the effectiveness of treatments.
- 4)CRP is therefore a test of value in medicine, reflecting the presence and intensity of inflammation, although an elevation in C-reactive protein is not the telltale diagnostic sign of any one condition.

ESR (ERYTHROCYTE SEDIMENTATION RATE)

Test Description	Value(s)	Unit(s)	Reference Range
ESR (Erythrocyte Sedimentation Rate) (Whole Blood)	40	mm/hr	< 20

Interpretation:

High ESR is not diagnostics of any disease but just indicative of some inflammatory process. ESR is to be used to monitor outcome of therapy. Microcytic anemia can increase ESR. High ESR can also be seen in apparently healthy adults.
